  ö
                            This sequence is the LysG protein product, a lysine export regulator. LysG and LysE encode a lysine transport regulatory protein and an export protein, respectively. Microbial production of amino acids (A) is improved by increasing the export-carrier activity and/or the export gene expression in a microorganism that produces (A). The method is specifically used to increase production of lysine, used as an animal feed additive. Other (A) are variously useful as plarmaceuticals, condiments and intermediates for fine chemicals. This method increases the amount of (A) secreted into the culture medium. Export of (A) has been found to depend on a single gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Corynebacterium glutamicum; metabolic pathway protein; MP protein; fine chemical production; microorganism; organic acid; nucleoside; nonproteinogenic amino acid; purine base; pyrimidine base; nucleotide; lipid; saturated fatty acid; unsaturated fatty acid; diol; vitamin; carbohydrate; aromatic compound; cofactor; polyketide; enzyme.

inscrolides which are useful for the control of arachnids, nematodes and insects. Blosynthesis of spinosyns occurs via stepwise condensation and diffication of carboxylic acid precursors generating a linear polyketide which is modified further. The DNA sequence contains a central region of approximately 55kb which has homology to the DNA encoding the polyketide synthases (FKS) of known macrolide producers. The spinosyn PKS DNA region consists of 5 ORPS with stop codons at the end of acyl carrier protein (ACP) domains. Together the PKS polypeptides (AAX39297-X39301), form a complex consisting of an initiator module, spnA, and several extender modules spnB-spnE. The products of the genes present in the region upstream of the PKS genes have been assigned names spnB-spnS region upstream of the PKS genes have been assigned names spnB-spnS spinosyn blosynthesis. There are also two ORFS ORFL15 and oRFL16 present immediately upstream of spnS, producing polypeptides AAX39318-Y39319. It is suggested that the ORFL16 producing polypeptides AAX39318-Y39319. It is suggested that the ORFL16 producing polypeptides AAX39318-Y39319. It is suggested that the ORFL16 protein is involved in transcriptional control during spinosyn and in spinosyn biosynthesis. The modified spinosyns may be a new insect on repinosyn biosynthesis. The modified spinosyns may be a new insect in spinosyn biosynthesis. The modified spinosyns may be a new insect control agent or serve as substrates for further chemical modification and the creation of new semi-synthesis or other species by but is a production of new semi-synthesis or other species by but is a production of new semi-synthesis or other species by

                                                                                                                                                                                                                                                                                                         activator gene. The snpR activator gene is incorporated in novel plasmid paWT195 (see AAV01451) that also includes the snpR-activated snpA promoter and a modified doxA gene (see AAV0147) of Streptomyces sp. strain C5. The doxA gene codes for daunomycin C-14 hydroxylase (see AAW36128), an enzyme capable of converting daunomycin to the anticancer agent doxcrubicin. Host cells, especially Streptomyces host cells, transformed with paNT195 can be used in methods for the production of doxcrubicin from daunomycin or for the hydroxylation and oxidation of other

The present sequence is encoded by a fragment of pANT1201. This plasmid was used as a source of snpk, snph promoter, and multiple cloning site. The specification describes a method for the production of soluble, recombinant human endostatin in Streptomyces. Leader sequences of streptomyces sp. strain C5 Snph and S. venezuelae alpha-amylase proteins are linked to the N-terminal of endostatin. This ensures that endostatin protein is produced as a secreted, soluble protein which needs no refolding, is stable in the fermentation broth and is produced in large quantities. The method is used for preparing soluble recombinant human, murine or primate endostatin, which is useful in the treatment of cancer, inhibition of tumour growth, inhibition of angiogenesis, isolation of receptors for endostatin and for identification of anti-angiogenic compounds in assays. The endostatin protein is produced as a secreted, soluble protein which needs no refolding, is stable in the fermentation broth and is produced in large quantities. Streptomycetes are amenable for cultivation in large fermentations allowing for large quantities of soluble endostatin to be produced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  13;

                                                                                                                                                                                   qq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAE53015 to AAE54536, AAE54577 to AAE54615, and AAY74253 to AAY5941 represent novel Neisseria meningitis and N. gonorrheae polynocleotides and polypeptides. AAE5457 to AAE5456 and AAE54616 to AAE5473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                            Neisseria meningitidis; Neisseria gonorrheae; antigen; vaccine; antigenic; diagnosis; immunogenic; infection; meningitis; septicaemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Scarselli M;

represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ5457 to AAZ54576 and AAZ54616 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the
                                                                                                                                                                                                                                                                          AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941
Novel Neisserial polypeptides predicted to be useful antigens for vaccines and diagnostics
                                                                                                                                                              Claim 2; Page 453; 1453pp; English.

P. aeruginosa is an opportunistic human pathogen present in soil water and plants. The specification describes virulence polypeptides and nucleic acid sequence encoding by polypeptides. These sequences can be used to identify a compound which is capable of decreasing the expression of a pathogenic virulence factor. Compounds that inhibit the expression or activity of virulence factor polypeptides can be used to treat pathogenic infections, especially where the infection is a P. aeruginosa infection.
         be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
presence of Neisseria bacteria, or to raise antibodies. They may also

The present sequence represents a narbonolide synthase subunit 4

(PICAIV). The nucleotide sequence encoding it is used in the course of the invention. The specification describes a recombinant DNA compound expressing recombinant polyketide synthase genes in host cells for the production of narbonolide, narbonolide derivatives and polyketides that are useful as antibiotics and as intermediates in the synthesis of compounds with pharmaceutical value. The DNA compounds may also encode a C12-hydroxyalse (picK), desosamine biosynthesis and desosaminyl cransferase enzymes (useful for conversion of ketolides to antibiotics), and the beta-glucosidase enzyme (involved in picromycin biosynthesis). These compounds are also useful for increasing the antibiotic activity of a compound relative to the unhydroxylated compound. The recombinant of a compound relative to the unhydroxylated compound. The recombinant of the narbonolide polyketide synthase. These would be valuable for creating novel ketolide analogs for pharmaceutical applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      14;
New recombinant pick hydroxylase gene of Streptomyces venezuelae useful for converting ketolides to antibiotics and as antibiotics and intermediates in the synthesis of compounds with pharmaceutical value
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Desosamine biosynthesis; macrolide; polyketide; methymycin; pikromycin;

```
production of biologically active macrolides. The macrolide biosynthetic production of biologically active macrolides. The macrolide biosynthetic production of biologically active macrolides. The macrolide biosynthetic neomethymycin and narbomycin. The alternative termination of polyketide synthesis may be useful to prepare novel antibiotics and polyhydroxyalkanoate (PHA) monomers. The compounds produced by the recombinant host cells are useful as biopolymers, e.g., in packaging or biologically active agents, such as chemotherapeutics, impunosuppressants, agents to treat asthma, chronic obstructive pulmonary disease as well as other diseases involving respiratory inflammation, cholesterol-lowering agents or macrolide-based antibiotics which are active against a variety of organisms, e.g., bacteria, including multi-drug resistant pneumococci and other respiratory pathogens, as well as viral parasitic pathogens, or as crop protection agents (e.g., fungicides or insecticides) via expression of polyketides in plants. Sequences AAY7190-Y77197 represent macrolide biosynthetic enzymes from second of the process of the content macrolide biosynthetic enzymes from the content and plants are encoded by sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    14;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     comprising a desosamine biosynthetic gene cluster, a fragment or its biologically active variant, where the nucleic acid sequence is not derived from the eryc gene cluster of Saccharopolyspora erythraea or Streptomyces antibioticus. The invention also relates to a macrolide biosynthetic gene cluster, or fragments thereof. The macrolide biosynthetic gene cluster encodes proteins which synthesise methymycin, pikromycin, narbomycin or a combination of these compounds. Recombinant or augmented cells comprising the desosamine and/or macrolide biosynthetic gene clusters are useful for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               purified nucleic acid segment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            800
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           142
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        143 REANPVAGCEVVELGTMRHLAIATPSLRDAYMVDGKLDWAAM-------PVLRFGPKDV 194

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CCAIV protein sequence The invention relates to recombinant DNA containing a coding sequence for a narbonolide polyketide synthase containing a coding sequence for a narbonolide polyketide synthase containing a coding sequence for a narbonolide polyketides are compounds synthesised from 2-carbon units through a series of condensations and subsequent modifications. Modular PKSs are responsible for the production of many antibiotics including picromycin. The narbonolide PKS consists of a loading module, sax extender modules, and two thiolester domains. Four proteins make up the narbonolide PKS (PICAII includes extender modules and a verender modules and a type II thioesterase domain. The second type II thioesterase domain. The socond type II thioesterase domain is found on the PICB protein. The nucleotide sequences encoding all of these proteins can be isolated in recombinant form from the recombinant cosmid pKOSQ33-37 (see AAZ56001). Narbonolide is desosamine biosynthetic genes are also found in cosmid pKOSQ33-37. The recombinant biosynthetic genes are also found in cosmid pKOSQ3-37. The recombinant considerase enzyme is section express, in transformed cells, narbonolide (or its derivatives) or other ketolides (particularly recombinantly expressed in the same hosts) to polyketide antibiotics or their intermediates. The antibiotics are useful in human or veterinary

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated and purified nucleic acid segment comprising a desosamine biosynthetic gene cluster, a fragment or its biologically active variant, where the nucleic acid sequence is not derived from the eryC gene cluster of Saccharopolyspora erythraea or Streptomyces antibioticus. The invention also relates to a macrolide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Desosamine and macrolide biosynthetic gene clusters, useful for, e .g. synthesis of methymycin and pikromycin -

AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAX75941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54574 to AAZ54576 and AAZ54616 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves may also be used as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61 EVLVQAARKMVLLQAETKAQLSGRLAEIPLTIAINADSLSTWFPPV------FNE- 109

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        õ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  14;
biosynthetic gene cluster, or fragments thereof. The macrolide biosynthetic gene cluster encodes proteins which synthesise methymycin, plikromycin, neomethymycin, narbomycin or a combination of these compounds. Recombinant or augmented cells comprising the desosamine and/or macrolide biosynthetic gene clusters are useful for the production of biologically active macrolides. The macrolide biosynthetic proteins are useful for synthesis of methymycin, pikromycin, neomethymycin and narbomycin. The alternative termination of polyketide synthesis may be moromers. The compounds produced by the recombinant host cells are useful so biomomer synthases or to prepare biologically active agents, such as chemotherapeutics, immunosuppressants, agents to treat astima, chronic obstructive pulmonary disease as well as other diseases involving
                                                                                                                                                                                                                                                                                                                                    respiratory inflammation, cholesterol-Lowering agents or macrolide-based antibiotics which are active against a variety of organisms, e.g., bacteria, including multi-drug resistant pneumococci and other respiratory pathogens, as well as viral parasitic pathogens, or as protection agents (e.g., fungicides or insecticides) via expression of probyketides in plants: The present sequence represents a protein encoded by the macrolide biosynthetic gene cluster (pik) from streptomyces venezuelae ATCC 15439.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             :| ::|::| | ||::| | : : | : | | :||1156 kggmislalseeatrgrienlh---glsiaavngptatvvsgdptqigelagaceadgir 11316

The functional irgB gene encodes a protein which acts as a positive regulator of irgA. IrgA functions as a V cholerae virulence factor. The sequence given shows a truncated irgB. This truncation of the sequence inhibts expression of a functional irgA gene product in the cell. This sequence can be used to transform V. cholerae calls which can then be used to induce immunity to cholera in a mammal. These transformed cells can colonize the intestines of inoculated animals and may be combined with vaccines targeted at other illnesses to make a single multi-valent vaccine. The transformed cells have reduced virulence such that the inoculated animal is less likely to develop
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cholera vaccine comprising live attenuated Vibrio cholerae cells - contains mutations which inhibit expression of a functional irgA gene product, vaccine has reduced virulence, decreasing side

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents a Amycolatopsis mediterranel rifamycin synthesis gene cluster ORF B protein from the present invention. The DNA fragment comprises a DNA region involved directly or indirectly in the gene cluster responsible for rifamycin synthesis, including the adjacent DNA regions to the right and left which, by reason of their function in connection with rifamycin biosynthesis, qualify as constituents of this rifamycin gene cluster, and functional fragments, derivatives or constituents of these. The Amycolatopsis mediterranel rifamycin synthesis gene cluster DNA fragment can be used for producing rifamycin, rifamycin analogues or precursors. It can also be used for inactivating or modifying genes involved in ansamycin or rifamycin biosynthesis. The DNA can be used for constructing mutant rifamycin biosynthesis gene cluster has been partly or completely deleted. The DNA fragment can be used for assembling a library of polyketide. The DNA fragment can be used for assembling a library of polyketides. A hybridisation probe of the invention can be used for identifying DNA fragments involved in the biosynthesis of ansamycins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               15;

Patent No. 5780300
GENERAL INFORMATION:
APPLICANT: Artavanis-Tsakonas, Spyridon
APPLICANT: Mark
APPLICANT: Matsuno, Kenji
TITLE OF INVENTION: MANIPULATION OF NON-TERMINALLY
TITLE OF INVENTION: DIFFERENTIATED CELLS USING THE NOTCH PATHWAY
NUMBER OF SEQUENCES: 4
